Total Mark : 15
Marks Obtained : 14

Section 1 : MCQ

1. Find the pre-order traversal of the given binary search tree.

Answer

13, 2, 1, 4, 14, 18

Status : Correct   *Marks : 1/1*

2. Find the in-order traversal of the given binary search tree.

Answer

1, 2, 4, 13, 14, 18

Status : Correct   *Marks : 1/1*

3. How many distinct binary search trees can be created out of 4 distinct keys?

Answer

14

Status : Correct   *Marks : 1/1*

4. Find the post-order traversal of the given binary search tree.

Answer

10, 17, 20, 18, 15, 32, 21

Status : Correct   *Marks : 1/1*

5. The preorder traversal of a binary search tree is 15, 10, 12, 11, 20, 18, 16, 19. Which one of the following is the postorder traversal of the tree?

Answer

11, 12, 10, 16, 19, 18, 20, 15

Status : Correct   *Marks : 1/1*

6. Which of the following is the correct in-order traversal of a binary search tree with nodes: 9, 3, 5, 11, 8, 4, 2?

Answer

2, 3, 4, 5, 8, 9, 11

Status : Correct   *Marks : 1/1*

7. Find the postorder traversal of the given binary search tree.

Answer

1, 4, 2, 18, 14, 13

Status : Correct   *Marks : 1/1*

8.   Which of the following is the correct post-order traversal of a binary search tree with nodes: 50, 30, 20, 55, 32, 52, 57?

Answer

20, 32, 30, 52, 57, 55, 50

Status : Correct   *Marks : 1/1*

9.   While inserting the elements 5, 4, 2, 8, 7, 10, 12 in a binary search tree, the element at the lowest level is _____.

Answer

12

Status : Correct   *Marks : 1/1*

10.   In a binary search tree with nodes 18, 28, 12, 11, 16, 14, 17, what is the value of the left child of the node 16?

Answer

14

Status : Correct   *Marks : 1/1*

11.   Find the preorder traversal of the given binary search tree.

Answer

9, 2, 1, 6, 4, 7, 10, 14

Status : Correct   *Marks : 1/1*

12. Which of the following is the correct pre-order traversal of a binary search tree with nodes: 50, 30, 20, 55, 32, 52, 57?

Answer

50, 30, 20, 32, 55, 52, 57

Status : Correct   *Marks : 1/1*

13. Which of the following is a valid preorder traversal of the binary search tree with nodes: 18, 28, 12, 11, 16, 14, 17?

Answer

18, 12, 11, 16, 14, 17, 28

Status : Correct   *Marks : 1/1*

14. While inserting the elements 71, 65, 84, 69, 67, 83 in an empty binary search tree (BST) in the sequence shown, the element in the lowest level is _____.

Answer

69

Status : Wrong   *Marks : 0/1*

15. Which of the following operations can be used to traverse a Binary Search Tree (BST) in ascending order?

Answer

Inorder traversal

Status : Correct   *Marks : 1/1*

Section 1 : Coding

1. Problem Statement

John is learning about Binary Search Trees (BST) in his computer science class. He wants to create a program that allows users to delete a node with a given value from a BST and print the remaining nodes using an in-order traversal.

Implement a function to help him delete a node with a given value from a BST.

Input Format

The first line of input consists of an integer N, representing the number of nodes in the BST.

The second line consists of N space-separated integers, representing the values of the BST nodes.

The third line consists of an integer V, which is the value to delete from the BST.

Output Format

The output prints the space-separated values in the BST in an in-order traversal, after the deletion of the specified value.

If the specified value is not available in the tree, print the given input values in-order traversal.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 5 15 2 7
15
Output: 2 5 7 10

Answer

```c
#include <stdio.h>
#include <stdlib.h>

struct TreeNode {
    int data;
    struct TreeNode* left;
    struct TreeNode* right;
};

struct TreeNode* createNode(int key) {
    struct TreeNode* newNode = (struct TreeNode*)malloc(sizeof(struct TreeNode));
    newNode->data = key;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct TreeNode* insert(struct TreeNode* root, int key) {
    if(root==NULL){
```

```c
        return createNode(key);
    }
    if(key<root->data){
        root->left=insert(root->left,key);
    } else if(key>root->data){
        root->right=insert(root->right,key);
    }
    return root;
}

struct TreeNode* findMin(struct TreeNode* root) {
    struct TreeNode* current=root;
    while(current && current->left!=NULL){
        current=current->left;
    }
    return current;
}

struct TreeNode* deleteNode(struct TreeNode* root, int key) {
    if(root==NULL){
        return root;
    }
    if(key<root->data){
        root->left=deleteNode(root->left,key);
    } else if(key > root->data){
        root->right=deleteNode(root->right,key);
    } else{
        if(root->left==NULL){
            struct TreeNode* temp=root->right;
            free(root);
            return temp;
        } else if(root->right==NULL){
            struct TreeNode* temp=root->left;
            free(root);
            return temp;
        }
        struct TreeNode* temp=findMin(root->right);
        root->data=temp->data;
        root->right=deleteNode(root->right,temp->data);
    }
    return root;
}
```

```c
void inorderTraversal(struct TreeNode* root) {
    if(root!=NULL){
        inorderTraversal(root->left);
        printf("%d ",root->data);
        inorderTraversal(root->right);
    }
}

int main()
{
    int N, rootValue, V;
    scanf("%d", &N);
    struct TreeNode* root = NULL;
    for (int i = 0; i < N; i++) {
        int key;
        scanf("%d", &key);
        if (i == 0) rootValue = key;
        root = insert(root, key);
    }
    scanf("%d", &V);
    root = deleteNode(root, V);
    inorderTraversal(root);
    return 0;
}
```

Input: 5
3 1 5 2 4

Output: 3 1 2 5 4

Answer

```c
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int value) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = value;
    newNode->left = newNode->right = NULL;
    return newNode;
}
// You are using GCC
struct Node* insert(struct Node* root, int value) {
    if(root==NULL)
        return createNode(value);
    if(value<root->data)
        root->left=insert(root->left,value);
    else if(value > root->data)
        root->right=insert(root->right,value);
    return root;
}

void printPreorder(struct Node* node) {
```

```c
        if(node!=NULL){
            printf("%d ",node->data);
            printPreorder(node->left);
            printPreorder(node->right);
        }
    }
    int main() {
        struct Node* root = NULL;

        int n;
        scanf("%d", &n);

        for (int i = 0; i < n; i++) {
            int value;
            scanf("%d", &value);
            root = insert(root, value);
        }

        printPreorder(root);
        return 0;
    }

Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

You are required to implement basic operations on a Binary Search Tree (BST), like insertion and searching.

Insertion: Given a list of integers, construct a Binary Search Tree by repeatedly inserting each integer into the tree according to the rules of a BST.

Searching: Given an integer, search for its presence in the constructed Binary Search Tree. Print whether the integer is found or not.

Write a program to calculate this efficiently.

Input Format

The first line of input consists of an integer n, representing the number of nodes

in the binary search tree.

The second line consists of the values of the nodes, separated by space as integers.

The third line consists of an integer representing, the value that is to be searched.

Output Format

The output prints, "Value <value> is found in the tree." if the given value is present, otherwise it prints: "Value <value> is not found in the tree."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 7
8 3 10 1 6 14 23
6
Output: Value 6 is found in the tree.

Answer

```c
#include<stdio.h>
#include<stdlib.h>
#include<stdbool.h>
struct Node{
int data;
    struct Node *left;
    struct Node *right;
};
struct Node* createNode(int data){
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data=data;
    newNode->left=NULL;
    newNode->right=NULL;
    return newNode;
}
struct Node* insert(struct Node* root,int data){
    if(root == NULL){
        return createNode(data);
    }
```

```c
        if(data < root->data){
            root->left=insert(root->left,data);
        } else if(data > root->data){
            root->right = insert(root->right, data);
        }
        return root;
    }
    bool search(struct Node* root, int key){
        if(root==NULL){
            return false;
        }
        if(key == root->data){
            return true;
        } else if(key < root->data){
            return search(root->left,key);
        } else {
            return search(root->right,key);
        }
    }
    int main(){
        int n, searchKey, value;
        struct Node* root = NULL;
        scanf("%d",&n);
        for(int i=0;i<n;i++){
            scanf("%d",&value);
            root=insert(root,value);
        }
        scanf("%d",&searchKey);
        if(search(root, searchKey)){
            printf("Value %d is found in the tree.\n", searchKey);
        } else {
            printf("Value %d is not found in the tree.\n",searchKey);
        }
        return 0;
    }
```

1. Problem Statement

John, a computer science student, is learning about binary search trees (BST) and their properties. He decides to write a program to create a BST, display it in post-order traversal, and find the minimum value present in the tree.

Help him by implementing the program.

Input Format

The first line of input consists of an integer N, representing the number of elements to insert into the BST.

The second line consists of N space-separated integers data, which is the data to be inserted into the BST.

Output Format

The first line of output prints the space-separated elements of the BST in post-order traversal.

The second line prints the minimum value found in the BST.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3
5 10 15
Output: 15 10 5
The minimum value in the BST is: 5

Answer

```c
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int data) {
    if (root == NULL) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else if (data > root->data) root->right = insert(root->right, data);
    return root;
}

void displayTreePostOrder(struct Node* root) {
```

```c
    if (root == NULL) return;
    displayTreePostOrder(root->left);
    displayTreePostOrder(root->right);
    printf("%d ", root->data);
}

int findMinValue(struct Node* root) {
    while (root->left != NULL) root = root->left;
    return root->data;
}

int main() {
    struct Node* root = NULL;

1. Problem Statement

John is building a system to store and manage integers using a binary search tree (BST). He needs to add a feature that allows users to search for a specific integer key in the BST using recursion.

Implement functions to create the BST and perform a recursive search for an integer.

Input Format

The first line of input consists of an integer representing, the number of nodes.

The second line consists of integers representing, the values of nodes, separated by space.

The third line consists of an integer representing, the key to be searched.

The output prints whether the given key is present in the binary search tree or not.

Refer to the sample output for the exact format.

Sample Test Case

Input: 7
10 5 15 3 7 12 20
12

Output: The key 12 is found in the binary search tree

Answer

```c
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node *left, *right;
} Node;

Node* createNode(int data) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

Node* insert(Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}

int search(Node* root, int key) {
    if (!root) return 0;
```

```
    if (root->data == key) return 1;
    if (key < root->data) return search(root->left, key);
    return search(root->right, key);
}

int main() {
    int N, key, val;
    scanf("%d", &N);
    Node* root = NULL;
    for (int i = 0; i < N; i++) {
        scanf("%d", &val);
        root = insert(root, val);
    }
    scanf("%d", &key);
    if (search(root, key))
        printf("The key %d is found in the binary search tree\n", key);
    else
        printf("The key %d is not found in the binary search tree\n", key);
    return 0;
}
```

Status : Correct   *Marks : 10/10*

2.   Problem Statement

Dhruv is working on a project where he needs to implement a Binary
Search Tree (BST) data structure and perform various operations on it.

He wants to create a program that allows him to build a BST, traverse it in
different orders (inorder, preorder, postorder), and exit the program when
needed.

Help Dhruv by designing a program that fulfils his requirements.

Input Format

The first input consists of the choice.

If the choice is 1, enter the number of elements N and the elements inserted into
the tree, separated by a space in a new line.

If the choice is 2, print the in-order traversal.

If the choice is 3, print the pre-order traversal.

If the choice is 4, print the post-order traversal.

If the choice is 5, exit.

Output Format

The output prints the results based on the choice.

For choice 1, print "BST with N nodes is ready to use" where N is the number of nodes inserted.

For choice 2, print the in-order traversal of the BST.

For choice 3, print the pre-order traversal of the BST.

For choice 4, print the post-order traversal of the BST.

For choice 5, the program exits.

If the choice is greater than 5, print "Wrong choice".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 1
5
12 78 96 34 55
2
3
4
5
Output: BST with 5 nodes is ready to use
BST Traversal in INORDER
12 34 55 78 96
BST Traversal in PREORDER
12 78 34 55 96

BST Traversal in POSTORDER
55 34 96 78 12

Answer

```c
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node *left, *right;
} Node;

Node* createNode(int data) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

Node* insert(Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);

        }
    }
    return 0;
}
```

3. Problem Statement

Edward has a Binary Search Tree (BST) and needs to find the k-th largest element in it.

Given the root of the BST and an integer k, help Edward determine the k-th largest element in the tree. If k exceeds the number of nodes in the BST, return an appropriate message.

Input Format

The first line of input consists of integer n, the number of nodes in the BST.

The second line consists of the n elements, separated by space.

The third line consists of the value of k.

Output Format

The output prints the kth largest element in the binary search tree.

For invalid inputs, print "Invalid value of k".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 7
8 4 12 2 6 10 14
1
Output: 14

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>
```

```c
typedef struct Node {
    int data;
    struct Node *left, *right;
} Node;

Node* createNode(int data) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

Node* insert(Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}

void reverseInorder(Node* root, int* k, int* result) {
    if (root && *k > 0) {
        reverseInorder(root->right, k, result);
        (*k)--;
        if (*k == 0) {
            *result = root->data;
            return;
        }
        reverseInorder(root->left, k, result);
    }
}

int findKthLargest(Node* root, int k) {
    int result = -1;
    reverseInorder(root, &k, &result);
    return result;
}

int main() {
    int N, k, val;
    scanf("%d", &N);
    Node* root = NULL;
    for (int i = 0; i < N; i++) {
```

```c
        scanf("%d", &val);
        root = insert(root, val);
    }
    scanf("%d", &k);
    int result = findKthLargest(root, k);
    if (result == -1)
        printf("Invalid value of k\n");
    else
        printf("%d\n", result);
    return 0;
}
```

1. Problem Statement

Yogi is working on a program to manage a binary search tree (BST) containing integer values. He wants to implement a function that removes nodes from the tree that fall outside a specified range defined by a minimum and maximum value.

Help Yogi by writing a function that achieves this.

Input Format

The first line of input consists of an integer N, representing the number of elements to be inserted into the BST.

The second line consists of N space-separated integers, representing the elements to be inserted into the BST.

The third line consists of two space-separated integers min and max, representing the minimum value and the maximum value of the range.

Output Format

The output prints the remaining elements of the BST in an in-order traversal, after removing nodes that fall outside the specified range.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 5 15 20 12
5 15
Output: 5 10 12 15

Answer

```c
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node *left, *right;
} Node;

Node* createNode(int data) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

Node* insert(Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}
```

```c
Node* trimBST(Node* root, int min, int max) {
    if (!root) return NULL;
    root->left = trimBST(root->left, min, max);
    root->right = trimBST(root->right, min, max);
    if (root->data < min) {
        Node* temp = root->right;
        free(root);
        return temp;
    }
    if (root->data > max) {
        Node* temp = root->left;
        free(root);
        return temp;
    }
    return root;
}

void inorder(Node* root) {
    if (root) {
        inorder(root->left);
        printf("%d ", root->data);
        inorder(root->right);
    }
}

int main() {
    int N, min, max, val;
    scanf("%d", &N);
    Node* root = NULL;
    for (int i = 0; i < N; i++) {
        scanf("%d", &val);
        root = insert(root, val);
    }
    scanf("%d %d", &min, &max);
    root = trimBST(root, min, max);
    inorder(root);
    printf("\n");
    return 0;
}
```

Status : Correct   *Marks : 10/10*

2. Problem Statement

Aishu is participating in a coding challenge where she needs to reconstruct a Binary Search Tree (BST) from given preorder traversal data and then print the in-order traversal of the reconstructed BST.

Since Aishu is just learning about tree data structures, she needs your help to write a program that does this efficiently.

Input Format

The first line consists of an integer n, representing the number of nodes in the BST.

The second line of input contains n integers separated by spaces, which represent the preorder traversal of the BST.

Output Format

The output displays n space-separated integers, representing the in-order traversal of the reconstructed BST.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 6
10 5 1 7 40 50
Output: 1 5 7 10 40 50

Answer

```c
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node *left, *right;
} Node;
```

```c
Node* createNode(int data) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

Node* insert(Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}

Node* constructBST(int preorder[], int size) {
    Node* root = NULL;
    for (int i = 0; i < size; i++) {
        root = insert(root, preorder[i]);
    }
    return root;
}

void inorderTraversal(Node* root) {
    if (root) {
        inorderTraversal(root->left);
        printf("%d ", root->data);
        inorderTraversal(root->right);
    }
}

int main() {
    int N;
    scanf("%d", &N);
    int preorder[N];
    for (int i = 0; i < N; i++) {
        scanf("%d", &preorder[i]);
    }
    Node* root = constructBST(preorder, N);
    inorderTraversal(root);
    printf("\n");
    return 0;
}
```

3. Problem Statement

Arun is exploring operations on binary search trees (BST). He wants to write a program with an unsorted distinct integer array that represents the BST keys and construct a height-balanced BST from it.

After constructing, he wants to perform the following operations that can alter the structure of the tree and traverse them using a level-order traversal:

InsertionDeletion

Your task is to assist Arun in completing the program without any errors.

Input Format

The first line of input consists of an integer N, representing the number of initial keys in the BST.

The second line consists of N space-separated integers, representing the initial keys.

The third line consists of an integer X, representing the new key to be inserted into the BST.

The fourth line consists of an integer Y, representing the key to be deleted from the BST.

Output Format

The first line of output prints "Initial BST: " followed by a space-separated list of keys in the initial BST after constructing it in level order traversal.

The second line prints "BST after inserting a new node X: " followed by a space-separated list of keys in the BST after inserting X n level order traversal.

The third line prints "BST after deleting node Y: " followed by a space-separated list of keys in the BST after deleting Y n level order traversal.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
25 14 56 28 12
34
12

Output: Initial BST: 25 14 56 12 28
BST after inserting a new node 34: 25 14 56 12 28 34
BST after deleting node 12: 25 14 56 28 34

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node *left, *right;
} Node;

typedef struct Queue {
    Node* node;
    struct Queue* next;
} Queue;

Node* createNode(int data) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

Node* sortedArrayToBST(int arr[], int start, int end) {
    if (start > end) return NULL;
    int mid = (start + end) / 2;
    Node* root = createNode(arr[mid]);
    root->left = sortedArrayToBST(arr, start, mid - 1);
    root->right = sortedArrayToBST(arr, mid + 1, end);
    return root;
```

```c
    }

    Node* insert(Node* root, int data) {
        if (!root) return createNode(data);
        if (data < root->data) root->left = insert(root->left, data);
        else root->right = insert(root->right, data);
        return root;
    }

4. Problem Statement

Joseph, a computer science student, is interested in understanding binary search trees (BST) and their node arrangements. He wants to create a program to explore BSTs by inserting elements into a tree and displaying the nodes using post-order traversal of the tree.

Write a program to help Joseph implement the program.

Input Format

The first line of input consists of an integer N, representing the number of elements to insert into the BST.

The second line consists of N space-separated integers data, which is the data to be inserted into the BST.

Output Format

The output prints N space-separated integer values after the post-order traversal.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 4
10 15 5 3
Output: 3 5 15 10

Answer

```c
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node *left, *right;
} Node;

Node* createNode(int data) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

Node* insert(Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}

void postorder(Node* root) {
    if (root) {
        postorder(root->left);
        postorder(root->right);
        printf("%d ", root->data);
    }
}

int main() {
    int N, val;
    scanf("%d", &N);
```

```
    Node* root = NULL;
    for (int i = 0; i < N; i++) {
        scanf("%d", &val);
        root = insert(root, val);
    }
    postorder(root);
    printf("\n");
    return 0;
}
```

Status : Correct   *Marks : 10/10*

5. Problem Statement

Viha, a software developer, is working on a project to automate searching for a target value in a Binary Search Tree (BST). She needs to create a program that takes an integer target value as input and determines if that value is present in the BST or not.

Write a program to assist Viha.

Input Format

The first line of input consists of integers separated by spaces, which represent the elements to be inserted into the BST. The input is terminated by entering -1.

The second line consists of an integer target, which represents the target value to be searched in the BST.

Output Format

If the target value is found in the BST, print "[target] is found in the BST".

Else, print "[target] is not found in the BST"

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5 3 7 1 4 6 8 -1

4
Output: 4 is found in the BST

Answer

```c
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

typedef struct Node {
    int data;
    struct Node *left, *right;
} Node;

Node* createNode(int data) {
    Node* newNode = (Node*)malloc(sizeof(Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

Node* insert(Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}

int search(Node* root, int target) {
    if (!root) return 0;
    if (root->data == target) return 1;
    if (target < root->data) return search(root->left, target);
    return search(root->right, target);
}

int main() {
    Node* root = NULL;
    int value, target;

    while (1) {
        scanf("%d", &value);
        if (value == -1) break;
        root = insert(root, value);
```

```c
    }

    scanf("%d", &target);

    if (search(root, target))
        printf("%d is found in the BST\n", target);
    else
        printf("%d is not found in the BST\n", target);

    return 0;
}
```
